

IDENTIKEY[®] Federation Server V1.0

A complete authentication and access management server, designed to validate user login on web-hosted applications.

IDENTIKEY Federation Server is extremely well suited for large corporations, governments, non-profit organizations and educational institutions looking to secure and manage access to different web-based applications and portals. With a continuous growing number of web-based applications each requiring its own logon procedure, IDENTIKEY Federation Server reduces overall complexity and provides customers with an unprecedented user experience while offering secure two-factor based user authentication.

IDENTITY & ACCESS MANAGEMENT PLATFORM

IDENTIKEY Federation Server is a server appliance providing you with the most powerful identity & access management platform. It is used to validate user credentials across multiple applications and disparate networks.

The solution validates users and creates an identity ticket enabling web single sign-on for different applications across organizational boundaries. As validated credentials can be reused, once a user's identity is confirmed, access to authorized services and applications is granted. Users can securely switch between the different applications and collaborate with colleagues, business partners, suppliers, customers and partners using one single identity.

IDENTIKEY Federation Server works as an Identity Provider within the local organization, but can also delegate authentication requests (for unknown users) to other Identity Providers. In a Federated Model, IDENTIKEY Federation Server does not only delegate but also receives authentication requests from other Identity Providers, when local users want to access applications from other organizations within the same federated infrastructure.

ENHANCED USER AND ADMINISTRATOR EXPERIENCE

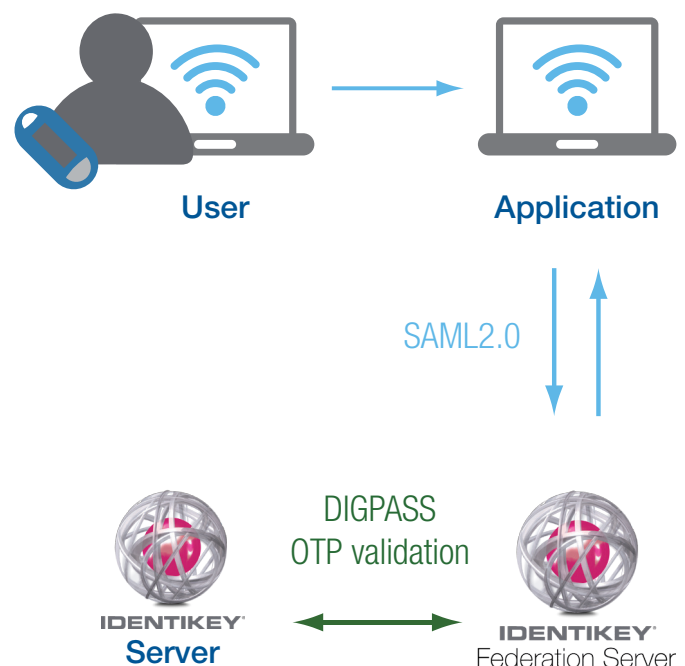

The web single sign-on feature provided by IDENTIKEY Federation Server greatly enhances end-user experience. End-users save time by sidestepping different logon procedures and are no longer obliged to memorize several password and username combinations. The company's administrator's task

is equally simplified. IDENTIKEY Federation Server comes with a single administrative interface and user repository removing the burden of maintaining diverse password databases and different authorization and authentication policies for each application separately.

TURNKEY SOLUTION, DIFFERENT AUTHENTICATION METHODS

IDENTIKEY Federation Server is delivered as a turnkey solution and includes an optimized high throughput and fully protected configuration. It is available as a Virtual Appliance, which allows a quick implementation within your virtualized architecture for a solid and optimal performance.

The server supports different types of authentication methods that can be combined with or tied to a specific application. The validation of one-time passwords is performed by IDENTIKEY server. IDENTIKEY Federation Server and IDENTIKEY Server work seamlessly together with VASCO's DIGIPASS[®] range which includes both hardware and software authentication methods.

BENEFITS

- One identity ticket to log-on to multiple applications
- Time-saving and highly efficient log-on method providing advanced user-experience
- Multiple authentication methods are supported, including application-specific authentication
- Web SSO- and Federated authentication are consolidated in one solution
- Single administrative interface and user repository
- Effortless deployment (up and running within the hour)
- No changes to existing infrastructure required (e.g. Active Directory schema)
- Low integration cost
- High ROI
- VASCO[®] offers its consultancy and professional services to customize its solution for your company specific application

FUNCTIONS

- Authentication Manager:
 - User Authentication: validation of user/password
 - Identity Provider: assigns a ticket to the user which can be re-used during a limited time)
- Access management to web-based applications

FEATURES

- Federated Authentication
- Web SSO
- Authentication Methods:
 - DIGIPASS two-factor authentication with IDENTIKEY as authentication server, including OTP delivery via SMS or e-mail (Virtual DIGIPASS)
 - Support for application-dependant authentication methods
 - Support for attribute release policies
- Scalability & Redundancy:
 - Fully scalable supporting high-availability setups
 - Integrated web-based management environment
 - Support for monitoring via SNMP
- Support for industry-standard communication protocols ensures smooth integration into existing infrastructures and applications.
 - SAML2.0 for IDENTIKEY Federation Server as Identity Provider (incoming requests)
 - SAML2.0 for IDENTIKEY Federation Server as Client/ Service Provider (outgoing requests)
 - ASselect protocol for IDENTIKEY Federation Server as Identity Provider and Service Provider (incoming/ outgoing requests)
 - ASselect WS protocol for IDENTIKEY Federation Server as Client/ Service Provider (outgoing requests)
- Basically any application that supports SAML2.0 can be supported.

About VASCO

VASCO designs, develops, markets and supports patented DIGIPASS[®], DIGIPASS PLUS, VACMAN[®], IDENTIKEY[®] and aXsGUARD[®] authentication products for the financial world, remote access, e-business and e-commerce. With tens of millions of products sold, VASCO has established itself as the world leader in Strong User Authentication for e-Banking and Enterprise Security for blue-chip corporations and governments worldwide.
